QuickStart Guide to PLATYPUS for Mac OS X

Requirements: Mac OS X 10.9 (Mavericks) or better.

Using an image editing program, rotate image as needed to be as vertical/horizontal as possible.

Go to Applications and open Platypus.

Mask areas that should not be incorporated into the cradle removal such as the black edges beyond the image.

Auto detect cradle.

If results are undesirable, try assisted detect. Note: the mask does not factor into the cradle detection, so a polygon may appear there.

Edit polygons (by clicking the alt key after a polygon is selected, the polygon can be rotated or an entire edge can be moved).

Choose File > Save Cradle to save it for use later

Remove cradle.

Individual polygons can be adjusted using the black, white and gamma sliders. Use arrow keys for incremental adjustments.

Click alt+ to copy adjustment to a new polygon

Click cmd+ to select multiple polygons

Click File > Export to save the image.

Go back into Platypus.

Run texture removal. This will take several hours.

Click File > Export to save the image.
